For open shell molecules

- magnetic moment \vec{m}_L owing to the orbital angular momentum $\vec{L} = \sum_i \vec{l}_i$
- magnetic moment \vec{m}_S owing to the electron spin angular momentum $\vec{S} = \sum_i \vec{s}_i$

イロト イヨト イヨト イヨト

EPR : transitions between electronic Zeeman states

interaction of a magnetic moment \vec{m} with an external magnetic field \vec{B} $H_{Ze} = -\vec{m} \cdot \vec{B}$

• for a pure spin doublet S = 1/2 with magnetic moment $\vec{m}_S = -\mu_B g_e \vec{S}$

 $hv = g_e \mu_B B_0$

イロン イヨン イヨン イヨン 三日

microwaves region

- for the X band, v = 9388 MHz
- for a spin doublet $B = hv/g_e\mu_B = 0.33$ T and hv=0.076 cm⁻¹
- for non pure spin systems, $\vec{m} \neq \mu_B g_e \vec{S}$
- the magnetic moment depends on the direction \Rightarrow anisotropy
- $\bullet\,$ for a magnetic field of $1T=10\,000$ G

$$\mu_B B = 0.46 \text{cm} - 1$$

イロト 不得 トイヨト イヨト 二日

EPR : hyperfine coupling

- coupling with the spins I of the nuclei \Rightarrow hyperfine structure
- $\vec{m}_I = \mu_N g_e \vec{l}$, since $\mu_N \ll \mu_B$, each electron Zeeman level is split into 2l + 1 lines

EPR : triplet state

 ${\scriptstyle \bullet}$ when $S \geq 1$, splitting of the M_S components in absence of magnetic field

zero-field splitting \Rightarrow fine structure

- there are two transitions $M_S = -1 \rightarrow M_S = 0$ and $M_S = 0 \rightarrow M_S = 1$
- High Field High Frequency EPR
- one can deduce the ZFS energies and the Zeeman components

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

g-factors from experiment

• energy gap between Zeeman states in a magnetic field $\vec{B} = B\vec{n}$

 $\Delta E = g \mu_B B$

• the g-factor depends on the direction of the magnetic field, this anisotropy is modelled by a spin Hamiltonian

$$H_S = \mu_B \vec{B}^{\dagger} \cdot \mathbf{g} \cdot \tilde{S}$$

 $g = \pm \left[\vec{n}^{\dagger} \cdot \mathbf{g} \mathbf{g}^{\dagger} \cdot \vec{n} \right]^{1/2}$

• Experiments give access to the tensor

$$G = gg^{\dagger}$$

• One defines the principal g-factors g_i from G_i the principal values of G

$$g_i = \pm \sqrt{G_i}$$

(Toulouse)

イロト 不得 トイヨト イヨト 二日

Determination of the sign of g-factors

• by use of circularly polarized radiation, the relative intensities of a given transition using right- and left-handed senses give information about the sign of

g_×g_yg_z

• in the case of hyperfine coupling, when the sign of the hyperfine constant is known

イロト イヨト イヨト イヨト

Semiclassical approach: precession around a magnetic field

The anisotropy of the g-factors affects both the shape and the pulsation of the precession

the direction of the precession is defined by the sign of the product $g_x g_y g_z$

イロン イヨン イヨン イヨン

magnetic field \parallel to a principal axis z

Spin Hamiltonian

Model Hamiltonian

$$H_S = \vec{\tilde{S}}^{\dagger} \cdot \mathbf{D} \cdot \vec{\tilde{S}} + \mu_B \vec{B}^{\dagger} \cdot \mathbf{g} \cdot \vec{\tilde{S}}$$

- it is a phenomenological relation expressed with spin operators
- $\vec{\tilde{S}}$ is a pseudo spin operator acting in the model space.
- With spin-orbit coupling, the true spin operator \overrightarrow{S} is not a good quantum number.
- In the case of a small spin-orbit coupling, $\vec{\tilde{S}} \approx \vec{S}$ (transition metal complexes)
- otherwise, the value of \tilde{S} is chosen to suit the size of the model space
 - the size of the model space is $2\tilde{S}+1$ generated by the $\left| ilde{M}_{S}
 ight
 angle$ functions

イロン イヨン イヨン イヨン 三日

Spin Hamiltonian

spin algebra

• in the model space, algebra of spins

$$\begin{split} \tilde{S}_{z} \left| \tilde{M}_{Sz} \right\rangle &= M_{S} \left| \tilde{M}_{Sz} \right\rangle \\ \tilde{S}_{+} \left| \tilde{M}_{Sz} \right\rangle &= M_{S} \sqrt{(\tilde{S} + \tilde{M}_{S} + 1)(\tilde{S} - \tilde{M}_{S})} \right| \tilde{M}_{S} + 1z \rangle \\ \tilde{S}_{-} \left| \tilde{M}_{Sz} \right\rangle &= M_{S} \sqrt{(\tilde{S} - \tilde{M}_{S} + 1)(\tilde{S} + \tilde{M}_{S})} \right| \tilde{M}_{S} - 1z \rangle \end{split}$$

• in other directions

$$\begin{array}{lcl} \tilde{S}_{x} \big| \tilde{M}_{Sx} \big\rangle &=& M_{S} \big| \tilde{M}_{Sx} \big\rangle \\ \tilde{S}_{y} \big| \tilde{M}_{Sy} \big\rangle &=& M_{S} \big| \tilde{M}_{Sy} \big\rangle \\ \tilde{S}_{z} \big| \tilde{M}_{Sz} \big\rangle &=& M_{S} \big| \tilde{M}_{Sz} \big\rangle \end{array}$$

• rotation in the spin space \mathscr{R} : rotation $z \to x \to y \to z$ \mathscr{R}' : rotation $z \to y \to x \to z$

$$\begin{array}{lll} \mathscr{R} \big| \tilde{M}_{Sz} \big\rangle & = & \big| \tilde{M}_{Sx} \big\rangle \\ \mathscr{R}' \big| \tilde{M}_{Sz} \big\rangle & = & \big| \tilde{M}_{Sy} \big\rangle \end{array}$$

3

イロト イヨト イヨト イヨト

EPR spin Hamiltonian

$$H_S = \vec{\tilde{S}}^{\dagger} \cdot \mathbf{D} \cdot \vec{\tilde{S}} + \mu_B \vec{B}^{\dagger} \cdot \mathbf{g} \cdot \vec{\tilde{S}}$$

- D is a two-rank tensor, usually traceless : the ZFS tensor
- **g** is in general not a tensor but $\mathbf{G} = \mathbf{g}\mathbf{g}^{\dagger}$ is
- the principal axis of **D** and **G** are not the same in general

э

イロト イヨト イヨト イヨト

- the spin space is an ideal world in which the algebra is well defined : "all is for the best in the best of all possible worlds" (Candide Voltaire)
- the phenomenological parameters can be extracted from experimental data by the fitting of physical observables.
 - the model is presupposed
- quantum chemical calculations
 - validation of the model
 - 2 calculation of the parameters

イロン イ団 とく ヨン イヨン

WFT for open shell systems

- the wave function of an open shell system is multideterminantal
- for example 2 electrons in 2 orbitals a and b
 - a triplet S = 1

$$egin{array}{rcl} |1,1
angle&=&|ab|\ |1,0
angle&=&rac{1}{\sqrt{2}}\left(\left|aar{b}
ight|+|ar{a}b|
ight)\ |1,-1
angle&=&\left|ar{a}ar{b}
ight| \end{array}$$

• a singlet S = 0

$$|0,0
angle = rac{1}{\sqrt{2}}\left(\left|aar{b}\right| - \left|ar{a}b
ight|
ight)$$

• in the case of no ZFS, $|1,1\rangle |1,0\rangle$ and $|1,-1\rangle$ are degenerate, but the response to a magnetic field is different is different for the three components

- model space of size $2\tilde{S}+1$
- relationship between these matrices and the spin Hamiltonian simplified thanks to the properties of symmetry

イロン イ団 とく ヨン イヨン

Time reversal symmetry

Electric field vs magnetic field

Schrödinger equation of a particle with charge q

• in an electric field

$$i\hbar \frac{\partial \psi(r,t)}{\partial t} = \left[-\frac{\hbar^2}{2m} \nabla^2 + q \Phi(r) \right] \psi(r,t) \tag{1}$$

 $\psi^*(r,-t)$ is a solution of (1)

• in a magnetic field

$$i\hbar \frac{\partial \psi(r,t)}{\partial t} = \frac{1}{2m} \left[-i\hbar \nabla - \frac{q}{c} A(r) \right]^2 \psi(r,t)$$
⁽²⁾

 $\psi^*(r,-t)$ is not a solution of (2) but of the equation with reversed magnetic field

<ロ> <四> <四> <四> <三</p>

$\bullet~\Theta$ is a **antilinear** and **antiunitary** operator

time reversal operator in \vec{r} representation, for systems with spatial and spin degrees of freedom

$$\Theta = K e^{-i\pi S_y/\hbar} = e^{-i\pi S_y/\hbar} K$$

where K is the conjugation operator.

イロン イ団 とく ヨン イヨン

• Zero-field Hamiltonian

$$H = \frac{|p|^2}{2m} + V(\vec{r}) + f(r)\vec{L}\cdot\vec{S}$$

commutes with time reversal

• The angular momentum operators

$$\Theta \vec{M} \Theta^{\dagger} = -\vec{M} \qquad \vec{M} = \vec{L}, \vec{S}, \vec{J}$$

anticommutes with time reversal

э

イロト 不得 トイヨト イヨト

Kramers degeneracy

• $\Theta^2 = e^{-2\pi i S_y/\hbar}$

- total spin rotation of angle 2π about the y-axis
 - for bosons $\Theta^2 = 1$
 - for fermions $\Theta^2 = -1$

<ロ> <四> <四> <四> <三</p>

Kramers degeneracy

• $\Theta^2 = e^{-2\pi i S_y/\hbar}$

• total spin rotation of angle 2π about the y-axis

- for bosons $\Theta^2 = 1$
- for fermions $\Theta^2 = -1$
- $\bullet ~ |\Psi\rangle$ and $\Theta |\Psi\rangle$ are degenerate
- if $|\Psi\rangle$ is non degenerate

$$egin{aligned} \Theta \left| \Psi
ight
angle &= e^{ilpha} \left| \Psi
ight
angle \ \end{aligned} \ \Theta^2 \left| \Psi
ight
angle &= \Theta e^{ilpha} \left| \Psi
ight
angle &= e^{-ilpha} \Theta \left| \Psi
ight
angle &= \left| \Psi
ight
angle \end{aligned}$$

possible for bosons, not for fermions
Kramers degeneracy

• $\Theta^2 = e^{-2\pi i S_y/\hbar}$

• total spin rotation of angle 2π about the y-axis

- for bosons $\Theta^2 = 1$
- for fermions $\Theta^2 = -1$
- $\bullet ~ |\Psi\rangle$ and $\Theta |\Psi\rangle$ are degenerate
- if $|\Psi\rangle$ is non degenerate

$$\begin{split} \Theta \left| \Psi \right\rangle &= e^{i\alpha} \left| \Psi \right\rangle \\ \Theta^{2} \left| \Psi \right\rangle &= \Theta e^{i\alpha} \left| \Psi \right\rangle = e^{-i\alpha} \Theta \left| \Psi \right\rangle = \left| \Psi \right\rangle \end{split}$$

· ...

possible for bosons, not for fermions

- In time-reversal invariant systems with an odd number of fermions, the energy levels have a degeneracy that is even.
- Kramers degeneracy is lifted by any effect that breaks the time-reversal invariance, for example external magnetic fields.

イロン イボン イヨン イヨン 三日

Magnetic moment of a non-degenerate state

• if $|\Psi\rangle$ is non degenerate

$$\left\langle \Psi \left| \vec{M} \right| \Psi \right\rangle = \left\langle \Theta \Psi \left| \vec{M} \right| \Theta \Psi \right\rangle$$
$$= -\left\langle \Psi \left| \vec{M} \right| \Psi \right\rangle$$
$$= 0$$

• The magnetic moment of a non-degenerate state vanishes

イロン イヨン イヨン イヨン 三日

conclusion

• the magnetic moment operator is antisymmetrical towards time inversion

$$\Theta ec{M} \Theta^\dagger = -ec{M}$$

- the zero-field energy of a system with an odd number of fermions have a degeneracy that is even. This degeneracy is lifted by external magnetic field.
- The magnetic moment of a non-degenerate state vanishes

- for transition metal complexes with a quenched orbital momentum and S=1
- the anisotropic magnetic properties are due to the zero field splitting since the Zeeman interaction is almost isotropic
- the anisotropy is larger with a scheme $E_x \simeq E_y \ll E_z$

summary

• 🙂

- the symmetry of the wave function is well defined
- the wave functions of all the components of degenerate states are known
- use of the single symmetry to describe dynamical correlation : cheaper and usual machinery
- 😳
- a lot of SF excited states needs to be calculated for the correct description of the ground state
- not systematic improvement of the calculation
- for lanthanide and actinide, crystal field is a perturbation of the SOC

イロト イヨト イヨト イヨト

- from the matrices of magnetic moments, one gets all information about the response to an external magnetic field.
- ullet restriction to a model space \Longrightarrow spin Hamiltonian parameters
- for the calculation of the ZFS tensor, needs a two-step method
- the results are satisfactory but numerical accuracy not reached

イロト イヨト イヨト イヨト

- Liviu Chibotaru, Liviu Ungur (Leuven)
- Nathalie Guihéry, Jean-Paul Malrieu (Toulouse), Rémi Maurice (Nantes)
- Elena Malkin (Tromsø), Dayán Páez Hernández (Santiago)
