Overview

- 1 The context
- Routing packets with fixed communication routes
- 3 Resolution of the "fluidified" problem
- 4 Building a schedule
- 5 Routing packets with freedom on the communication paths

Platform

Platform : heterogeneous and distributed :

- processors with different capabilities;
- communication links of different characteristics.

Applications

Application made of a very (very) large number of tasks, the tasks can be clustered into a finite number of types, all tasks of a same type having the same characteristics.

Principle

When we have a very large number of identical tasks to execute, we can imagine that, after some initiation phase, we will reach a (long) steady-state, before a termination phase.

If the steady-state is long enough, the initiation and termination phases will be negligible.

Overview

- 1 The context
- 2 Routing packets with fixed communication routes
- 3 Resolution of the "fluidified" problem
- 4 Building a schedule
- 5 Routing packets with freedom on the communication paths

The problem

Problem : sending a set of message flows.

In a communication network, several flow of packets must be dispatched, each packet flow must be sent from a route to a destination, while following a given path linking the source to the destination.

 $\bullet \ (V,A)$ an oriented graph, representing the communication network.

ullet (V,A) an oriented graph, representing the communication network.

ullet A set of n_c flows which must be dispatched.

- \bullet (V,A) an oriented graph, representing the communication network.
- ullet A set of n_c flows which must be dispatched.
- The k-th flow is denoted (s_k, t_k, P_k, n_k) , where

- \bullet (V,A) an oriented graph, representing the communication network.
- ullet A set of n_c flows which must be dispatched.
- The k-th flow is denoted (s_k, t_k, P_k, n_k) , where
 - s_k is the source of packets;

- \bullet (V,A) an oriented graph, representing the communication network.
- ullet A set of n_c flows which must be dispatched.
- The k-th flow is denoted (s_k, t_k, P_k, n_k) , where
 - s_k is the source of packets;
 - ullet t_k is the destination;

- \bullet (V,A) an oriented graph, representing the communication network.
- ullet A set of n_c flows which must be dispatched.
- The k-th flow is denoted (s_k, t_k, P_k, n_k) , where
 - s_k is the source of packets;
 - t_k is the destination;
 - ullet P_k is the path to be followed;

- \bullet (V,A) an oriented graph, representing the communication network.
- ullet A set of n_c flows which must be dispatched.
- The k-th flow is denoted (s_k, t_k, P_k, n_k) , where
 - s_k is the source of packets;
 - t_k is the destination;
 - P_k is the path to be followed;
 - ullet n_k is the number of packets in the flow.

- (V, A) an oriented graph, representing the communication network.
- ullet A set of n_c flows which must be dispatched.
- The k-th flow is denoted (s_k, t_k, P_k, n_k) , where
 - s_k is the source of packets;
 - t_k is the destination;
 - ullet P_k is the path to be followed;
 - n_k is the number of packets in the flow. We denote by $a_{k,i}$ the i-th edge in the path P_k .

Hypotheses

 \bullet A packet goes through an edge A in a unit of time.

Hypotheses

 \bullet A packet goes through an edge A in a unit of time.

• At a given time, a single packet traverses a given edge.

Objective

We must decide which packet must go through a given edge at a given time, in order to minimize the overall execution time.

Lower bound on the duration of schedules

We call **congestion** of edge $a \in A$, and we denote by C_a , the total number of packets which go through edge a:

$$C_a = \sum_{k \mid a \in P_k} n_k \qquad C_{\max} = \max_a C_a$$

Lower bound on the duration of schedules

We call **congestion** of edge $a \in A$, and we denote by C_a , the total number of packets which go through edge a:

$$C_a = \sum_{k \mid a \in P_k} n_k \qquad C_{\max} = \max_a C_a$$

 C_{max} is a lower bound on the execution time of any schedule.

$$C^* \ge C_{\max}$$

Lower bound on the duration of schedules

We call **congestion** of edge $a \in A$, and we denote by C_a , the total number of packets which go through edge a:

$$C_a = \sum_{k \mid a \in P_k} n_k \qquad C_{\max} = \max_a C_a$$

 $C_{
m max}$ is a lower bound on the execution time of any schedule.

$$C^* \ge C_{\max}$$

A "fluid" (fractional) resolution of our problem will give us a solution which executes in a time $C_{\rm max}$.

Overview

- 1 The context
- Routing packets with fixed communication routes
- 3 Resolution of the "fluidified" problem
- 4 Building a schedule
- 5 Routing packets with freedom on the communication paths

Fluidified (fractional) version: notations

Principle:

• we do not look for an integral solution but for a rational one.

Fluidified (fractional) version: notations

Principle:

• we do not look for an integral solution but for a rational one.

• $n_{k,i}(t)$ (fractional) number of packets waiting at the entrance of the i-th edge of the k-th path, at time t.

Fluidified (fractional) version: notations

Principle:

• we do not look for an integral solution but for a rational one.

- $n_{k,i}(t)$ (fractional) number of packets waiting at the entrance of the i-th edge of the k-th path, at time t.
- $T_{k,i}(t)$ is the overall time used by the edge $a_{k,i}$ for packets of the k-th flow, during the interval of time [0;t].

Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each k

Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each k

Conservation law

$$n_{k,i+1}(t) = T_{k,i}(t) - T_{k,i+1}(t),$$
 for each k

Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each k

Conservation law

$$n_{k,i+1}(t) = T_{k,i}(t) - T_{k,i+1}(t),$$
 for each k

Resource constraints

$$\sum_{(k,i) \mid a_{k,i}=a} T_{k,i}(t_2) - T_{k,i}(t_1) \le t_2 - t_1, \forall a \in A, \forall t_2 \ge t_1 \ge 0$$

Initiating the communications

$$n_{k,1}(t) = n_k - T_{k,1}(t),$$
 for each k

Conservation law

$$n_{k,i+1}(t) = T_{k,i}(t) - T_{k,i+1}(t),$$
 for each k

Resource constraints

$$\sum_{(k,i) \mid a_{k,i}=a} T_{k,i}(t_2) - T_{k,i}(t_1) \le t_2 - t_1, \forall a \in A, \forall t_2 \ge t_1 \ge 0$$

Objective

$$\text{Minimize } C_{\mathsf{frac}} = \int_0^\infty \mathbb{1} \left(\sum_{k,i} n_{k,i}(t) \right) dt$$

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k
- $\bullet \ n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t), \qquad \text{ for each } k$

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k
- $\bullet \ n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t), \qquad \text{ for each } k$
- \bullet At any time t, $\sum_{j=1}^{i}n_{k,j}(t)=n_k-T_{k,i}(t)$

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k
- $n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t)$, for each k
- ullet At any time t, $\sum_{j=1}^i n_{k,j}(t) = n_k T_{k,i}(t)$
- For each edge a:

$$\sum_{(k,i)|a_{k,i}=a} \sum_{j=1}^{s} n_{k,j}(t) = \sum_{(k,i)|a_{k,i}=a} n_k - \sum_{(k,i)|a_{k,i}=a} T_{k,i}(t)$$

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k
- $n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t)$, for each k
- $\bullet \ \ \text{At any time } t, \, \sum_{j=1}^i n_{k,j}(t) = n_k T_{k,i}(t)$
- ullet For each edge a:

$$\sum_{(k,i)|a_{k,i}=a} \sum_{j=1}^{n} n_{k,j}(t) = \sum_{(k,i)|a_{k,i}=a} n_k - \sum_{(k,i)|a_{k,i}=a} T_{k,i}(t) \ge C_a - t$$

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k
- $n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t)$, for each k
- $\bullet \ \ \text{At any time } t, \, \sum_{j=1}^i n_{k,j}(t) = n_k T_{k,i}(t)$
- For each edge a:

$$\sum_{(k,i)|a_{k,i}=a} \sum_{j=1}^{c} n_{k,j}(t) = \sum_{(k,i)|a_{k,i}=a} n_k - \sum_{(k,i)|a_{k,i}=a} T_{k,i}(t) \ge C_a - t$$

As long as $t < C_a$, there are packets in the system.

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k
- $n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t)$, for each k
- $\bullet \ \ \text{At any time } t, \, \sum_{j=1}^i n_{k,j}(t) = n_k T_{k,i}(t)$
- ullet For each edge a:

$$\sum_{(k,i)|a_{k,i}=a} \sum_{j=1}^{c} n_{k,j}(t) = \sum_{(k,i)|a_{k,i}=a} n_k - \sum_{(k,i)|a_{k,i}=a} T_{k,i}(t) \ge C_a - t$$

As long as $t < C_a$, there are packets in the system.

Therefore, $C_{\text{frac}} \geq \max_a C_a = C_{\max}$

For $t \leq C_{\max}$

For
$$t \leq C_{\max}$$

$$\bullet \ T_{k,i}(t) = \frac{n_k}{C_{\max}} t \text{, for each } k \text{ and } i.$$

For $t \leq C_{\text{max}}$

•
$$T_{k,i}(t) = \frac{n_k}{C_{\max}} t$$
, for each k and i .

•
$$n_{k,1}(t) = n_k - T_{k,1}(t) = n_k - \frac{n_k}{C_{\text{max}}}t = n_k \left(1 - \frac{t}{C_{\text{max}}}\right), \quad \forall k$$

For $t \leq C_{\max}$

•
$$T_{k,i}(t) = \frac{n_k}{C_{\max}} t$$
, for each k and i .

$$\bullet \ n_{k,1}(t) = n_k - T_{k,1}(t) = n_k - \frac{n_k}{C_{\max}} t = n_k \left(1 - \frac{t}{C_{\max}}\right), \quad \forall k$$

• $n_{k,i}(t) = 0$, for each k and $i \ge 2$.

For $t \leq C_{\max}$

- $T_{k,i}(t) = \frac{n_k}{C_{\max}} t$, for each k and i.
- $n_{k,1}(t) = n_k T_{k,1}(t) = n_k \frac{n_k}{C_{\text{max}}} t = n_k \left(1 \frac{t}{C_{\text{max}}} \right)$, $\forall k$
- $n_{k,i}(t) = 0$, for each k and $i \ge 2$.

For $t \geq C_{\max}$

For $t \leq C_{\max}$

- $T_{k,i}(t) = \frac{n_k}{C_{\max}} t$, for each k and i.
- $n_{k,1}(t) = n_k T_{k,1}(t) = n_k \frac{n_k}{C_{\text{max}}}t = n_k \left(1 \frac{t}{C_{\text{max}}}\right), \quad \forall k$
- $\bullet \ n_{k,i}(t) = 0 \text{, for each } k \text{ and } i \geq 2.$

For $t \geq C_{\max}$

$$\bullet \ T_{k,i}(t) = n_k$$

For $t \leq C_{\max}$

- $\bullet \ T_{k,i}(t) = \frac{n_k}{C_{\max}} t, \ \text{for each} \ k \ \text{and} \ i.$
- $n_{k,1}(t) = n_k T_{k,1}(t) = n_k \frac{n_k}{C_{\text{max}}} t = n_k \left(1 \frac{t}{C_{\text{max}}} \right)$, $\forall k$
- $n_{k,i}(t) = 0$, for each k and $i \ge 2$.

For $t \geq C_{\max}$

- $\bullet \ T_{k,i}(t) = n_k$
- $n_{k,i}(t) = 0$

For $t \leq C_{\text{max}}$

- $\bullet \ T_{k,i}(t) = \frac{n_k}{C_{\max}} t, \ \text{for each} \ k \ \text{and} \ i.$
- $n_{k,1}(t) = n_k T_{k,1}(t) = n_k \frac{n_k}{C_{\text{max}}} t = n_k \left(1 \frac{t}{C_{\text{max}}} \right), \quad \forall k$
- $n_{k,i}(t) = 0$, for each k and $i \ge 2$.

For $t \geq C_{\max}$

- $T_{k,i}(t) = n_k$
- $n_{k,i}(t) = 0$

This solution is a schedule of makespan $C_{\rm max}$. We still have to show that it is feasible.

Checking the solution (for $t \leq C_{\max}$)

Checking the solution (for $t \leq C_{\max}$)

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k Satisfied by definition.
- $\begin{array}{ll} \bullet & n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t), & \text{for each } k \\ & T_{k,i}(t) T_{k,i+1}(t) = \frac{n_k}{C_{\max}} t \frac{n_k}{C_{\max}} t = 0 = n_{k,i+1}(t) \end{array}$

Checking the solution (for $t \leq C_{\max}$)

- $n_{k,1}(t) = n_k T_{k,1}(t)$, for each k Satisfied by definition.
- $\begin{array}{ll} \bullet & n_{k,i+1}(t) = T_{k,i}(t) T_{k,i+1}(t), & \text{for each } k \\ & T_{k,i}(t) T_{k,i+1}(t) = \frac{n_k}{C_{\max}} t \frac{n_k}{C_{\max}} t = 0 = n_{k,i+1}(t) \end{array}$

$$\sum_{\substack{(k,i) \mid a_{k,i}=a \\ (k,i) \mid a_{k,i}=a}} T_{k,i}(t_2) - T_{k,i}(t_1) \le t_2 - t_1, \forall a \in A, \forall t_2 \ge t_1 \ge 0$$

$$\sum_{\substack{(k,i) \mid a_{k,i}=a \\ C_{a} \\ C_{max}}} T_{k,i}(t_2) - T_{k,i}(t_1) = \sum_{\substack{(k,i) \mid a_{k,i}=a \\ C_{max}}} \frac{n_k}{C_{max}}(t_2 - t_1) = \frac{C_a}{C_{max}}(t_2 - t_1) \le t_2 - t_1$$

Overview

- The context
- Routing packets with fixed communication routes
- Resolution of the "fluidified" problem
- 4 Building a schedule
- 5 Routing packets with freedom on the communication paths

• $\Omega \approx$ duration of a round (will be defined later).

- $\Omega \approx$ duration of a round (will be defined later).
- ullet m_k : number of packets of k-th flow distributed in a single round.

$$m_k = \left\lceil \frac{n_k \Omega}{C_{\text{max}}} \right\rceil.$$

- $\Omega \approx$ duration of a round (will be defined later).

$$\leq \Omega + D_{\max}$$

• $N_{k,i}(t)$: number of packets of the k-th flow waiting at the entrance of the i-th edge, at time t.

- $N_{k,i}(t)$: number of packets of the k-th flow waiting at the entrance of the i-th edge, at time t.
- $a_{k,1}$ sends m_k packets during $[0, \Omega + D_{\max}]$. $N_{k,1}(\Omega + D_{\max}) = n_k m_k$

- $N_{k,i}(t)$: number of packets of the k-th flow waiting at the entrance of the i-th edge, at time t.
- $a_{k,1}$ sends m_k packets during $[0, \Omega + D_{\max}]$. $N_{k,1}(\Omega + D_{\max}) = n_k m_k$
- $a_{k,1}$ sends m_k packets during $[\Omega + D_{\max}, 2(\Omega + D_{\max})]$. $N_{k,1}(2(\Omega + D_{\max})) = n_k 2m_k$

- $N_{k,i}(t)$: number of packets of the k-th flow waiting at the entrance of the i-th edge, at time t.
- $a_{k,1}$ sends m_k packets during $[0, \Omega + D_{\max}]$. $N_{k,1}(\Omega + D_{\max}) = n_k m_k$
- $a_{k,1}$ sends m_k packets during $[\Omega + D_{\max}, 2(\Omega + D_{\max})]$. $N_{k,1}(2(\Omega + D_{\max})) = n_k 2m_k$
- We let $T = \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max})$

$$N_{k,1}(T) \leq n_k - \frac{T}{\Omega + D_{\max}} m_k \leq n_k - \frac{n_k \Omega}{C_{\max}} \frac{C_{\max}}{\Omega} = 0$$

Propagation delay

- $a_{k,1}$ sends m_k packets during $[0,\Omega+D_{\max}]$. $N_{k,1}(\Omega+D_{\max})=n_k-m_k \qquad \qquad N_{k,2}(\Omega+D_{\max})=m_k$ $N_{k,i\geq 3}(\Omega+D_{\max})=0$
- $\begin{array}{ll} \bullet \ a_{k,1} \ \text{sends} \ m_k \ \text{packets during} \ [\Omega + D_{\max}, 2(\Omega + D_{\max})]. \\ N_{k,1}(2(\Omega + D_{\max})) = n_k 2m_k \quad N_{k,2}(2(\Omega + D_{\max})) = m_k \\ N_{k,3}(2(\Omega + D_{\max})) = m_k \quad N_{k,i \geq 4}(2(\Omega + D_{\max})) = 0 \end{array}$
- The delay between the time a packet traverses the first edge of the path P_k and the time it traverses its last edge is, at worst : $(|P_k|-1)(\Omega+D_{\max})$ We let $L=\max_k |P_k|$.

$$C_{\mathsf{total}} \leq T + (L-1)(\Omega + D_{\max})$$

$$\begin{aligned} C_{\mathsf{total}} &\leq T + (L - 1)(\Omega + D_{\max}) \\ &= \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max}) + (L - 1)(\Omega + D_{\max}) \end{aligned}$$

$$\begin{split} C_{\mathsf{total}} &\leq T + (L-1)(\Omega + D_{\max}) \\ &= \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ &\leq \left(\frac{C_{\max}}{\Omega} + 1 \right) (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \end{split}$$

$$\begin{split} C_{\mathsf{total}} &\leq T + (L-1)(\Omega + D_{\max}) \\ &= \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ &\leq \left(\frac{C_{\max}}{\Omega} + 1 \right) (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ &= C_{\max} + LD_{\max} + \frac{D_{\max}C_{\max}}{\Omega} + L\Omega \end{split}$$

$$\begin{split} C_{\mathsf{total}} & \leq T + (L-1)(\Omega + D_{\max}) \\ & = \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ & \leq \left(\frac{C_{\max}}{\Omega} + 1 \right) (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ & = C_{\max} + LD_{\max} + \frac{D_{\max}C_{\max}}{\Omega} + L\Omega \end{split}$$

The lower bound is minimized by $\Omega = \sqrt{\frac{D_{\max}C_{\max}}{L}}$

$$\begin{split} C_{\mathsf{total}} &\leq T + (L-1)(\Omega + D_{\max}) \\ &= \left\lceil \frac{C_{\max}}{\Omega} \right\rceil (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ &\leq \left(\frac{C_{\max}}{\Omega} + 1 \right) (\Omega + D_{\max}) + (L-1)(\Omega + D_{\max}) \\ &= C_{\max} + LD_{\max} + \frac{D_{\max}C_{\max}}{\Omega} + L\Omega \end{split}$$

The lower bound is minimized by
$$\Omega = \sqrt{\frac{D_{\max}C_{\max}}{L}}$$

$$C_{\text{total}} \leq C_{\max} + 2\sqrt{C_{\max}D_{\max}L} + D_{\max}L$$

Asymptotic optimality

$$C_{\max} \leq C^* \leq C_{\mathsf{total}} \leq C_{\max} + 2\sqrt{C_{\max}D_{\max}L} + D_{\max}L$$

$$1 \leq \frac{C_{\mathsf{total}}}{C_{\mathsf{max}}} \leq 1 + 2\sqrt{\frac{D_{\mathsf{max}}L}{C_{\mathsf{max}}}} + \frac{D_{\mathsf{max}}L}{C_{\mathsf{max}}}$$

With
$$\Omega = \sqrt{\frac{D_{\mathrm{max}}C_{\mathrm{max}}}{L}}$$

Resources needed

$$\sum_{(k,i)|a_{k,i}=a,k\geq 2} m_k \leq \sum_{(k,i)|a_{k,i}=a,k\geq 2} \left(\frac{n_k}{C_{\max}} \sqrt{\frac{D_{\max}C_{\max}}{L}} + 1 \right)$$
$$\leq \sqrt{\frac{D_{\max}C_{\max}}{L}} + D_{\max}$$

Conclusion

- We forget the initiation and termination phases
- Rational resolution of the steady-state
- Round whose size is the square-root of the solution :
 - Each round "loses" a constant amount of time
 - The sum of the waisted times increases less quickly than the schedule
 - Buffers of size the square-root of the solution

- ullet A set of n_c collection of packets which must be dispatched.
- Each collection of packets is dispatched through a set of flows (the packets of a same collection may follow different paths).
- ullet $n^{k,l}$ the total number of packets to be dispatched from k to l.

- Same problem than previously, but the communication paths are not fixed.
- ullet A set of n_c collection of packets which must be dispatched.
- Each collection of packets is dispatched through a set of flows (the packets of a same collection may follow different paths).
- ullet $n^{k,l}$ the total number of packets to be dispatched from k to l.
- $n_{i,j}^{k,l}$: the total number of packets to be dispatched from k to l and which go through the edge (i,j).

- Same problem than previously, but the communication paths are not fixed.
- ullet A set of n_c collection of packets which must be dispatched.
- Each collection of packets is dispatched through a set of flows (the packets of a same collection may follow different paths).
- ullet $n^{k,l}$ the total number of packets to be dispatched from k to l.
- $n_{i,j}^{k,l}$: the total number of packets to be dispatched from k to l and which go through the edge (i,j).

Congestion :
$$C_{i,j} = \sum_{(k,l)|n^{k,l}>0} n_{i,j}^{k,l}$$
 $C_{\max} = \max_{i,j} C_{i,j}$.

Initiating the communications

$$\sum_{j|(k,j)\in A} n_{k,j}^{k,l} = n^{k,l}$$

Initiating the communications

$$\sum_{j|(k,j)\in A} n_{k,j}^{k,l} = n^{k,l}$$

Receiving the messages sent

$$\sum_{i|(i,l)\in A} n_{i,l}^{k,l} = n^{k,l}$$

Initiating the communications

$$\sum_{j|(k,j)\in A} n_{k,j}^{k,l} = n^{k,l}$$

Receiving the messages sent

$$\sum_{i|(i,l)\in A} n_{i,l}^{k,l} = n^{k,l}$$

Conservation law

$$\sum_{i|(i,j)\in A} n_{i,j}^{k,l} = \sum_{i|(j,i)\in A} n_{j,i}^{k,l} \quad \forall (k,l), j\neq k, j\neq l$$

Congestion

$$C_{i,j} = \sum_{(k,l)|n^{k,l}>0} n_{i,j}^{k,l}$$

Congestion

$$C_{i,j} = \sum_{(k,l)|n^{k,l}>0} n_{i,j}^{k,l}$$

Defining the objective

$$C_{\max} \ge C_{i,j}, \quad \forall i, j$$

Congestion

$$C_{i,j} = \sum_{(k,l)|n^{k,l}>0} n_{i,j}^{k,l}$$

Defining the objective

$$C_{\max} \ge C_{i,j}, \quad \forall i, j$$

Objective function

Minimiser C_{\max}

Congestion

$$C_{i,j} = \sum_{(k,l)|n^{k,l}>0} n_{i,j}^{k,l}$$

Defining the objective

$$C_{\max} \ge C_{i,j}, \quad \forall i, j$$

Objective function

Minimiser C_{max}

Linear program in rational numbers : can be solved in polynomial time by any linear program solver.

Routing algorithm

 ${\color{red} \bullet}$ Compute the optimal value $C_{\rm max}$ of the previous linear program.

Routing algorithm

- ① Compute the optimal value C_{max} of the previous linear program.
- 2 Let Ω be some value later defined. During the interval $[p\Omega,(p+1)\Omega]$, the edge (i,j) forwards :

$$m_{i,j}^{k,l} = \left\lfloor rac{n_{i,j}^{k,l}\Omega}{C_{ ext{max}}}
ight
floor$$

packets which go from k to l.

Routing algorithm

- ① Compute the optimal value C_{max} of the previous linear program.
- ② Let Ω be some value later defined. During the interval $[p\Omega,(p+1)\Omega]$, the edge (i,j) forwards :

$$m_{i,j}^{k,l} = \left\lfloor rac{n_{i,j}^{k,l}\Omega}{C_{ ext{max}}}
ight
floor$$

packets which go from k to l.

Starting at time :

$$T \equiv \left\lceil \frac{C_{\text{max}}}{\Omega} \right\rceil \Omega \le C_{\text{max}} + \Omega$$

we process the M remaining sequentially, which takes a time ML (at worst) where L is the maximal length of a simple path in the network.

The schedule is feasible

$$\sum_{(k,l)} m_{i,j}^{k,l} \leq \sum_{(k,l)} \frac{n_{i,j}^{k,l} \Omega}{C_{\max}} = \frac{C_{i,j} \Omega}{C_{\max}} \leq \Omega$$

Makespan

- We define Ω by : $\Omega = \sqrt{C_{\max} n_c}$.
- ullet The total number of packets remaining in the network at time T is at worst :

$$2|A|\sqrt{C_{\max}n_c} + |A|n_c$$

The makespan is then

$$C_{\max} \le C^* \le C_{\max} + \sqrt{C_{\max} n_c} + 2|A|\sqrt{C_{\max} n_c}|V| + |A|n_c|V|$$
